4th Conference on Next Generation Sequencing for Adventitious Virus Detection in Biologics for Humans and Animal

Frankfurt, Germany
December 3-5, 2024

Selecting and developing approaches for adventitious virus detection by HTS, contrasting release testing with investigational follow-up

Authors:

- **Carine Logvinoff**: Virology Global Analytical Expert, Global AS & Regulatory Compliance, Analytical Sciences, Sanofi Vaccines, Marcy l'Etoile
- **Song Sun**: Unit Head, High-Throughput Sequencing, Molecular Biology Centre, Analytical Sciences, Sanofi Vaccines, Toronto

Multiple approaches for adventitious virus detection by HTS (e.g., viromics, genomics, transcriptomics) are described in Ph.Eur 2.6.41. Within this presentation, we will discuss Sanofi Vaccines' rationale for approach selection based on sample type, considering both validated release testing as well as investigational testing. We will also discuss how we designed and configured our HTS pipeline for testing under both scenarios.

This work was funded by Sanofi.
